SpectraDye™ Secondary Antibodies

Fluorescently label antibodies

Description

Advansta offers a broad selection of SpectraDye Secondary Antibodies with a variety of conjugate types, including visible and near infrared (NIR) fluorescent dyes. Choose the label and species best suited for your application. Each high quality antibody offers unparalleled sensitivity and performance. Additionally, achieve fast and convenient workflow when using the dyes in conjunction with Advansta's WesternBright™ MCF system for multi-color fluorescent Westerns.

Advantages

- **Performance** – strong signal and no cross-reactivity
- **Convenience** – each antibody is demonstrated to provide optimal results with Advansta's Western blotting systems
- **Flexibility** – choose the label and target species best suited to your application

February 25, 2016 | D-26032-406

Tips

- Western Blotting requires optimization of both primary and secondary antibody concentrations. These must be determined for every target-antibody pair.
- A good starting dilution of secondary antibodies labeled with SpectraDye is 1:2500-1:5000.
- Our antibodies can be imaged on a wet blot.
- When optimizing the secondary antibody concentration, save the diluted secondary antibody solution after membrane incubation. If greater sensitivity is needed, more secondary antibody can be added to the solution and the membrane re-incubated in the solution and final washes repeated.
